Pet Adoption & Shelter Management System — Problem Statement #57

Use Case: UC-02 — Submit Adoption Application

E1. Invalid or Incomplete Input

E1.1. Applicant leaves a required questionnaire field blank or enters malformed data (e.g., non-numeric household size).

E1.2. System detects the validation error at step 3 and displays the message: "Please complete all required fields before submitting your application.", highlighting the offending field(s) in red.

E1.3. System keeps the form populated with the applicant's existing entries and does not create an application record.

E1.4. Applicant corrects the flagged field(s) and resumes at step 2 of the Main Success Scenario.

E2. System / Connectivity Failure

E2.1. Applicant submits the questionnaire, but the client cannot reach the backend or the backend cannot save the record to the database.

E2.2. System displays the message: "We couldn't submit your application due to a system error. Your answers have been saved on this device — we'll retry when the connection is back."

E2.3. The client (browser) stores the in-progress answers locally, since the server cannot save them, so no data is lost. No application record is created on the server.

E2.4. The failure is logged for Shelter Staff / IT review: by the backend if it was reachable, otherwise by the client, which reports it on reconnection.

E2.5. Once connectivity is restored, the client reloads the locally saved draft; the applicant reviews it and resumes at step 2 of the Main Success Scenario. If the server confirms the application had already been created (step 5) before the failure, the local draft is discarded and the flow continues at step 6.
